Project: Heart Disease Analysis using Heart_new2 Dataset

PS-1

I am: Cardiologist / Hospital Administrator

I'm trying to: Identify patients at risk of heart disease by analyzing age, BMI, smoking, diabetes, stroke history, physical activity, general health and other clinical factors from the Heart_new2 dataset.

But: The dataset contains thousands of patient records that are difficult to interpret manually.

Because: There is no centralized dashboard to visualize patient risk factors, disease distribution and health trends.

Which makes me feel: Frustrated because identifying high-risk patients and making timely healthcare decisions becomes slower and less data-driven.

PS-2

I am: Healthcare Data Analyst

I'm trying to: Analyze relationships between demographic, lifestyle and medical factors such as BMI, Smoking, Diabetes, Physical Activity, Kidney Disease and HeartDisease using interactive Tableau dashboards.

But: Raw healthcare data contains many attributes that are difficult to analyze without proper visualization.

Because: Manual analysis is time-consuming and hidden trends are easily overlooked.

Which makes me feel: Inefficient because valuable insights that could improve patient care and preventive strategies may be missed.

Problem to Solution Flow

Heart_new2 Dataset → Data Cleaning & Preprocessing → Tableau Dashboard & Story → Heart Disease Risk Analysis → Clinical Insights → Better Decision Making & Preventive Healthcare
